ABSTRACT: In the context of an organisation/company or business, operational scope is very important, including all risks. PT XYZ continues to demonstrate performance metrics with a compliance rate of less than 100% in the conduct of its business and is considered a risk in the Company's operational framework. Therefore, the purpose of this research is to propose improvement or control solutions to reduce operational risk and recommend the risk management ISO 31000 version of treatment. In principle, 2 (two) calculation steps were performed in this study, namely before and after providing repair solutions. The methods used are Failure Modes and Effects Analysis (FMEA) and risk matrix, Pareto charts are used to rank risks from highest to lowest, and fishbone diagrams to analyze repair solutions. As a result, the total risk score becomes R8 = 2.40 to 1.60, followed by a decrease from R2 = 0.96 to 0.16, R1 = 0.36 to 0.24, R6 = 0.108 to 0.03, R7 = 0.108 to 0.03, R4 = 0.096 to 0.02, R3 = 0.06 to 0.02 and R5 = 0.036 to 0.02. From the categorization of the risk matrix there is then also a decrease in impact which originally had 5 (five) low risk categories to 6 (six) risks, then 1 (one) medium risk and the remaining 1 (one) extreme risk. In accordance with ISO 31000:2018 risk management recommendations that risk before control, namely accepting risk is applied to 5 (five) risks, risk mitigation is applied to 1 (one) risk, avoiding risk is applied to 2 (two) risks. Risk after control, namely accepting risk is applied to 6 (six) risks, risk mitigation is applied to 1 (one) risk and risk avoidance is applied to 1 (one) risk.

Keywords: operational risk, FMEA, risk matrix, pareto diagram, fishbone diagram.

1. Introduction

In the business world, you must face uncertainty. This element of uncertainty often results in a loss, this occurs due to a lack of information about what will happen. This is a universal trait, almost always present in all aspects of human life. As we all feel, in the last few years we have been hit by the Covid-19 pandemic where many companies have been affected. Losses from this element of uncertainty (risk) can manifest in various ways, both in terms of finance, law, technology, employment, policy, operational, political, social and so on. For this reason, in order to overcome all risks that may occur, a process called risk management is needed.

PT XYZ is a petrochemical company with a vision and mission: "to become a world-class petrochemical and energy company, to run an integrated petrochemical and energy commercial business based on principles of integrity". However, later in the operational process there were still risks that had quite an impact on the management of the business unit. Supposedly

with the mission of becoming a world-class company, it is appropriate that all existing risks can be eliminated by implementing the principle of continuous improvement. Based on the results of observations, the following data show that in the last 2 (two) years performance indicators with an achievement score of less than 100% are still found within the operational scope of PT XYZ.

 Table 1 Performance Indicators Not Achieved in 2020-2021

| Indicators | % |
|--------------------------|---|
| Audit Internal, External | |
| and ISO | 96.69 |
| Restorative Capex | 99.30 |
| CSR Program | 37.60 |
| Performance Management | 89.20 |
| | Indicators Audit Internal, External and ISO Restorative Capex CSR Program Performance Management |

Source: Data processing, 2022.

2. Methodology

Broadly speaking, the stages carried out are divided into two stages of the research flow,

namely the analysis stage with FMEA (Failure Mode and Effect Analysis) and Risk matrix mapping analysis, followed by corrective steps using Fishbone Diagram and Pareto Diagrams. In the analysis using FMEA, a value in the form of RPN (Risk Potential Number) will be obtained for each risk, then for Risk matrix analysis, the impact category for each risk will be obtained. For the improvement stage, namely using a Fishbone diagram, namely brainstorming about each risk. By doing brainstorming, various points of view regarding existing operational risks will be obtained, so as to get a solution to the problem. After the proposed control (solution/further action and monitoring) has been carried out, the researcher then performs calculations again to be able to analyze the results before and after control is carried out.

3. Results

From the observation results, it was found that Operational GM KPI (Key Performance Indicators) data for 2022 which had not been achieved were then identified as operational risks which were divided into several categories or sections according to the main performance indicators or sections in PT XYZ, as well as to facilitate handling and making risk register as in the following table.

| Table 2 Performance Indicators That Have Not |
|---|
| Been Achieved in 2022 |

| No. | Key Performance Indicators | Section | |
|-----|--|-----------------------|--|
| 1 | Company Performance Achievement Results | Economy | |
| 2 | Management of Production/Service Processes | Production | |
| 3 | Business Development | Quality Management | |
| 4 | Improvement in Employee Performance | Human Capital | |
| a | D | | |

Source: Data processing, 2022.

Furthermore, the risks can be identified from each existing section as shown in table 3. Then the risk weighting stage is the result of the weighting that was previously carried out by the company's management based on the grouping or main performance indicators in the company's operational department. The weighting results that have been set are as shown in table 4.

| Fable 3 | Risk | Identification | in | 2022 |

Furthermore, from the risk weighting in each of these sections, it can be cascaded again for each of the existing subsections, then from these subsections there are several more items. To make it clearer, the following is shown in table 5 below.

| Sect. No. | Item | (%) | Item | Value |
|-----------------------------|-----------------|-----|------|-------|
| 2 | Audit Internal, | 2 | 0,02 | 0,02 |

Table 5 Subsection Weighting Risk

Source: Data processing, 2022.

3.1 Failure Mode and Effect Analysis

After knowing the weight value of each section, the next step is to calculate the total risk value with the equation: NTR = RPN x NB Where: NTR = Total Risk Value,

RPN = Risk Potential Number,

NB = Weight Value.

The calculation is divided into two, namely the calculation before the control and after the control is carried out as presented in the following table.

A. Risk Before Control

Table 6 RPN Before Control

| Risk No. | Occurrence | Severity | Detection | RPN |
|-------------|------------|----------|-----------|-----|
| R1 | 2 | 3 | 3 | 18 |
| R2 | 4 | 4 | 3 | 48 |
| R3 | 1 | 3 | 5 | 15 |
| R4 | 2 | 3 | 4 | 24 |
| R5 | 1 | 3 | 3 | 9 |
| R6 | 3 | 3 | 3 | 27 |
| R7 | 3 | 3 | 3 | 27 |
| R8 | 3 | 4 | 5 | 60 |
| <u> </u> | 5 | 4 | 5 | 00 |

Source: Data processing, 2022.

B. Risk After Control

Table 7 RPN After Control

| Risk | Occurrence | Severity | Detection | RPN | |
|--------------------------------|------------|----------|-----------|-----|--|
| No. | | | | | |
| R1 | 1 | 3 | 4 | 12 | |
| R2 | 1 | 4 | 2 | 8 | |
| R3 | 1 | 2 | 3 | 6 | |
| R4 | 1 | 2 | 2 | 4 | |
| R5 | 1 | 2 | 2 | 4 | |

Then for more details the comparison (Total Risk Value) before and after can be seen in table 8 below.

Table 8 Comparison of Total Risk Value before and After Control

| No. | Risk | Before Control | | |
|-----|------------|----------------|--------------|---------------------|
| | No. | RPN | Weighting | Total Risk Value |
| 1 | R1 | 18 | 0,02 | 0,36 |

Source: Data processing, 2022.

From the results of the calculation of the NTR (Total Risk Value) above, it can be seen that there is a decrease after control is carried out by providing solutions, follow-up actions and monitoring.

3.2 Pareto Diagram

Furthermore, after obtaining the Total Risk Value, the next step is to enter the Pareto Diagram creation stage where a ranking order of the existing risks will be carried out. So that it is clear that there is a change from what was before the risk control was carried out and after the risk control was carried out.

A. Risk Before Control

Figure 1 Pareto Chart Before Control (FMEA) Source: Data processing, 2022.

Figure 2 Pareto Chart Before Control (Risk Matrix) Source: Data processing, 2022.

B. Risk After Control

Figure 3 Pareto Chart After Control (FMEA) Source: Data processing, 2022.

Figure 4 Pareto Chart After Control (Risk Matrix) Source: Data processing, 2022.

So, from the above calculation, there has been a 51.36% (FMEA) and than 49,62% (Risk Matrix) decrease in overall risk in PT XYZ. To make it clearer, the following table 9 summarizes the percentage reduction in risk.

| Table 9 Recapitulation of Risk Reduction |
|--|
| Percentage (FMEA) |

| No. | Risk No. | NTR A | NTR B | Reduction Percentage |
|-----|-------------|----------|----------|-------------------------|
| 1 | R1 | 0,36 | 0,24 | 66,67% |
| 2 | R2 | 0,96 | 0,16 | 16,67% |
| 3 | R3 | 0,06 | 0,02 | 33,33% |
| 4 | R4 | 0,096 | 0,02 | 20,83% |
| 5 | R5 | 0,036 | 0,02 | 55,56% |
| 6 | R6 | 0,108 | 0,03 | 27,78% |
| 7 | R7 | 0,108 | 0,03 | 27,78% |
| 8 | R8 | 2,4 | 1,6 | 66,67% |
| | Total | 4,128 | 2,120 | 51,36% |

Source: Data processing, 2022.

3.3 Fishbone Diagram

Fishbone diagram (Ishikawa Diagram) or also called Cause effects analysis can help to find the root of the problem and at the same time find a solution immediately. By doing brainstorming, various points of view regarding existing operational risks will be obtained, so as to get a solution to the problem. Improvement Solution is the result of mapping converted into Cause effects analysis/Fishbone Diagram. The following will be reviewed as shown in the figure and then tabulated as shown in Figure 3 below.

Figure 5 Operational KPI Fishbone Diagram Source: Data processing, 2022.

Matrices and vectors are in boldface type. (If these cannot be typed in italic and boldface, italic type can be indicated by a hand-drawn straight underline and boldface by a wavy underline). Unusual and Greek symbols should be typed in the text using the Symbol capability. If no Symbol capability is possible, such special characters should be identified by name in a marginal note. (This is important; the editor may be not familiar with these symbols and may have difficulty producing the correct one without a marginal note.) For equations that might be too long to type in a 6" column, indicate appropriate breaks.

| Table | 11 | Solution | |
|-------|----|----------|--|
|-------|----|----------|--|

| Factor | Problem | Solution | further action | | | | |
|------------------------|--|---|--|--|--|--|--|
| ractor | Troolem | Solution | Action | PIC | | | |

3.4 Risk Matrix

As in the previous calculation, after knowing the weight value of each section/item, the next step is to calculate the total risk value with the equation: $NTR = L \times C \times NB$ Where: NTR = Total Risk Value,

L = Likelihood,

So that from the calculation equation, the Total Risk Value is obtained before risk control (solutions, follow-up actions and monitoring) is carried out, from each subsection/item as shown in table 12 below.

| No. | Risk | Before Control | | | | |
|-----|------|----------------|-------|-----------|-------|----------|
| | No. | L | С | NB | NTR | Category |
| 1 | R1 | 2 | 3 | 0,02 | 0,12 | Medium |
| 2 | R2 | 4 | 4 | 0,02 | 0,32 | Extreme |

3. Conclusions

From the results of the research and discussion conducted on KPI (Key Performance Indicators) General Manager Operations, it can be concluded that:

- 1. During the data collection process, there were 8 (eight) risks (Risk Events) divided into 3 (three) main performance categories or indicators that occurred in operational KPIs (Key Performance Indicators) at PT XYZ.
- 2. After analyzing the risks that occur in the operational KPI (Key Performance Indicators) at PT XYZ in accordance with the Total Risk Value, it can be seen that the risk that has the greatest impact on operational sustainability is the category subsection/item Accuracy of Performance Management followed by Internal Audit, External & ISO, Restorative Capex and CSR Program.
- 3. The calculation is divided into 2 (two) calculation methods where the first calculation method is using FMEA so that the Total Risk Value is obtained, then the Probability & Impact Matrix calculation method is also used to obtain the Total Risk Value which is then converted into a risk matrix to risk mapping based on risk level or category.
- 4. Of all the existing risks, control, solutions/follow-up actions and monitoring or supervision were given and according to the

results of the discussion it succeeded in reducing operational risk at PT XYZ.

- 5. In accordance with ISO 31000:2018 Risk Management recommendations that based on the level of risk, risk treatment is divided into 4 (four) treatments according to the priority level of risk, which are as follows:
 - A. Risk Before Control
 - a) Accepting Risk (Risk Acceptance) is applied to 5 (five) risks.
 - b) Risk Mitigation (Risk Reduction) is applied to 1 (one) risk.
 - c) Transfer of risk (Risk Sharing) there is no risk.
 - d) Risk Avoidance is applied to 2 (two) risks.
 - B. Risk Before Control
 - a) Accepting Risk (Risk Acceptance) is applied to 6 (six) risks.
 - b) Risk Mitigation (Risk Reduction) is applied to 1 (one) risk.
 - c) Transfer of risk (Risk Sharing) there is no risk.
 - d) Risk Avoidance is applied to 1 (one) risk.
